

Q1. Use case Diagram

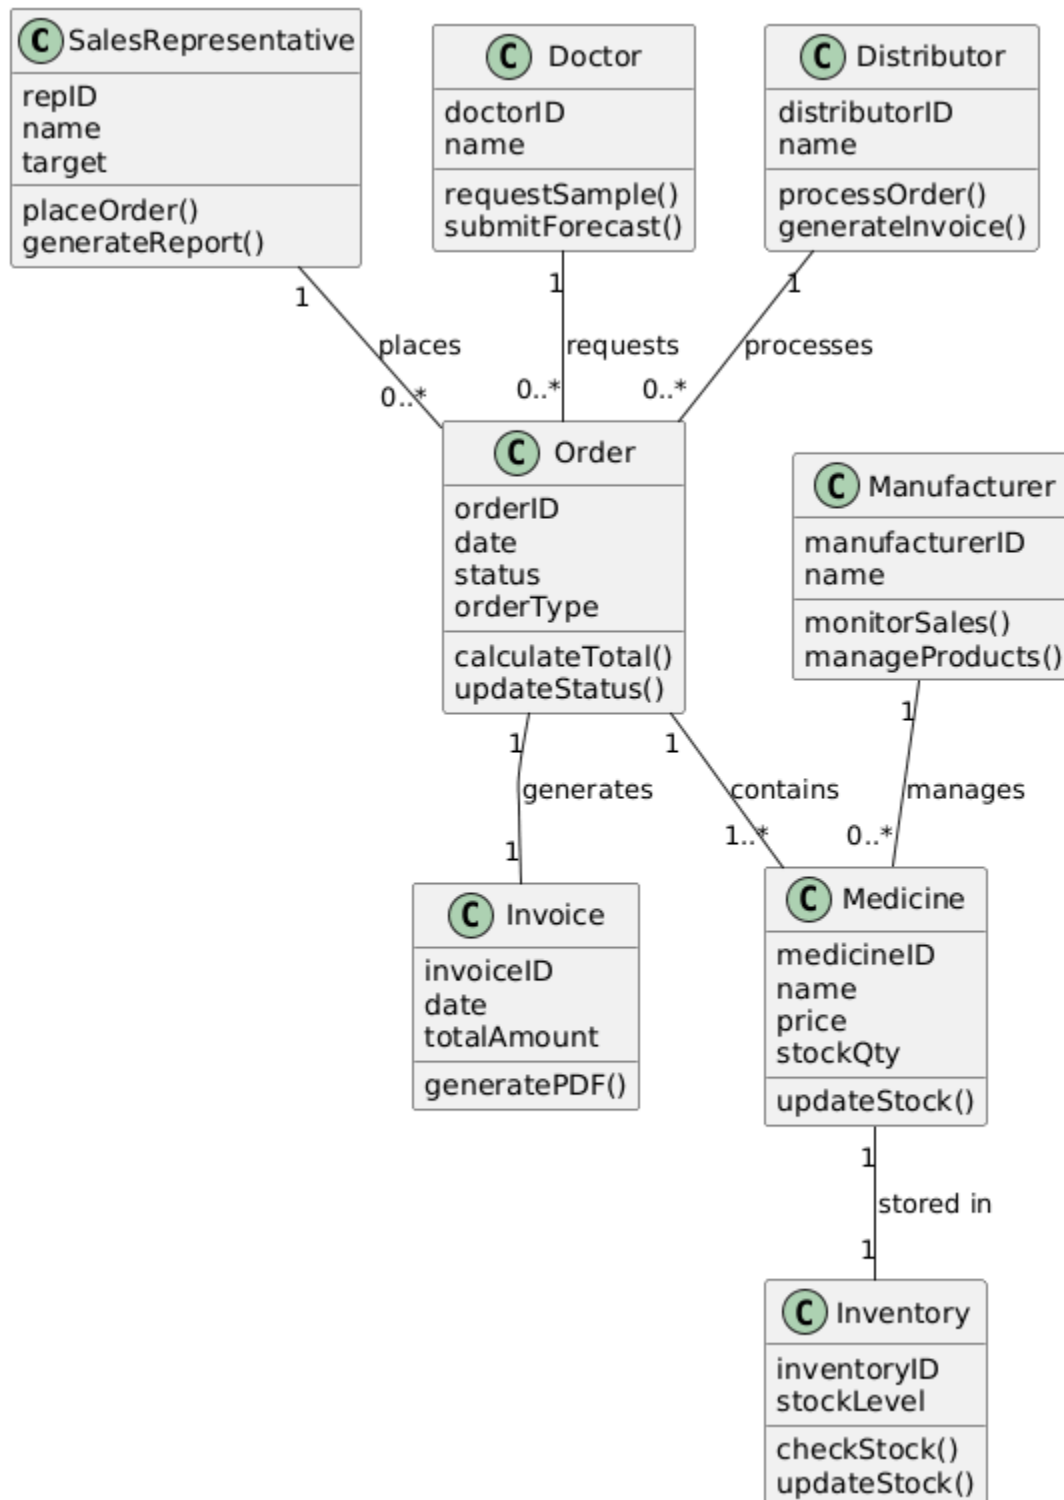

Rubrics: Correct actors identified 3, Relevant use cases shown 3, Correct <<include>> usage 3, Correct <<extend>> usage 3

Q2. Fully Dressed description Generate Invoice

Field	Description
Use Case Name	Generate Invoice
Primary Actor	Distributor
Supporting Actors	Accounting System
Description	Generates an invoice for completed medicine orders and records the transaction.
Preconditions	1. Order must be confirmed. 2. Medicines must be available in inventory.
Postconditions	1. Invoice is generated and stored. 2. Payment record is created. 3. Accounting system updated.
Trigger	Distributor selects a completed order for invoicing
Alternate Flows / Extensions	
Condition	System Behavior
Inventory mismatch	System displays error and prevents invoice generation
Accounting system unavailable	Invoice stored locally and synchronized later

Rubrics: Use case fields (actor, pre/post conditions etc.) 2 Main success scenario steps 2 Extensions / alternate flows 1 Clarity and assumptions 1

Q3. Class Diagram

Rubrics: Correct classes identified 2, Attributes & operations 1, Relationships 2, Multiplicity correctness 1

Question 4 – SDLC Model (6 Marks)

Most Appropriate Model

Agile / Iterative Model (e.g., Scrum or Unified Process)

Reasoning

The scenario states that **requirements are still evolving** and frequent client interaction is needed. Agile supports **continuous feedback and requirement changes**.

The development team has **limited domain understanding** of pharmaceutical sales. Iterative development allows:

- gradual learning
- incremental system improvements
- frequent validation with client

Rubrics: Correct SDLC model identified 3, Two relevant reasons explained 3
