

Q1. Activity Diagram

Q3. 4+1 View Model

View	Main Architectural Concern / Purpose	Example from Smart Parcel Locker System	Common UML Diagram
Logical View	Describes the main functional elements and object structure of the system. Focuses on what the system does in terms of services and domain concepts.	Core classes / entities such as Parcel , Locker , Customer , Courier , PickupCode , and LockerStation .	Class Diagram
Process View	Describes the dynamic behavior of the system, runtime interactions, workflows, concurrency, and communication between active parts.	Parcel deposit flow, parcel collection flow, retry attempts for invalid pickup code, parallel sending of mobile app and email notifications .	Sequence Diagram or Activity Diagram
Development View	Shows how the software is organized into modules, subsystems, or components from an implementation perspective.	Software modules such as Locker Controller , Notification Service , Validation Module , Support System , and Security Alert Service .	Component Diagram
Physical View	Describes the hardware / deployment environment and how software components are distributed across physical nodes.	Locker Station , Parcel Sensor , Customer Mobile App , Central Server , and network-based support / notification services.	Deployment Diagram
Scenarios (+1 View)	Captures important use cases and system behavior from the user's perspective to validate the architecture.	Example scenarios such as Deposit Parcel , Collect Parcel , Handle Invalid Pickup Code , and Report Problem .	Use Case Diagram

Q2: sequence diagram
